

Project Initialization and Planning Phase

Date	15 July 2024
Team ID	740771
Project Name	Car Performance Prediction
Maximum Marks	3 Marks

Define Problem Statement:

The problem statement for car performance prediction involves developing a model to accurately forecast the performance metrics of a car, such as speed, fuel efficiency, and handling.

This prediction is based on various input parameters like engine specifications, aerodynamics, weight, and environmental conditions. The goal is to provide reliable performance estimations that can guide manufacturers in design decisions, enhance vehicle optimization, and inform consumers.

Accurate predictions can lead to improved car designs, reduced emissions, and better fuel efficiency, ultimately advancing automotive engineering and market competitiveness.

We will also be deploying our model locally using Flask
